<b>Foreword by Richard Varga</b>	<b>xi</b>
<b>Preface</b>	<b>xiii</b>
<b>0 Introduction to iterative methods and preconditioning</b>	<b>1</b>
<b>1 Numerical linear algebra: background</b>	<b>5</b>
1.1 Review of matrix theory . . . . .	5
1.1.1 Basic matrix operations . . . . .	7
1.1.2 Matrix partitionings . . . . .	9
1.1.3 Basic concepts of matrix analysis . . . . .	10
1.1.4 Vector norms and matrix norms . . . . .	12
1.1.5 Computational work . . . . .	15
1.2 Eigenvalues and eigenvectors . . . . .	15
1.2.1 Relating norms and eigenvalues . . . . .	18
1.2.2 Convergence of vector and matrix sequences . . . . .	18
1.2.3 Perron-Frobenius theory of nonnegative matrices . . . . .	24
1.2.4 Diagonally dominant matrices . . . . .	28
1.2.5 Power method . . . . .	29
1.3 General linear systems . . . . .	32
1.3.1 Direct methods . . . . .	36
1.3.2 Iterative refinement . . . . .	40
<b>2 The theory of matrix splitting</b>	<b>41</b>
2.1 General properties of matrix splittings . . . . .	41
2.2 Regular splittings . . . . .	46
2.3 Nonnegative and weak nonnegative splittings . . . . .	52
2.4 Weak and weaker splittings . . . . .	61
2.5 Summary . . . . .	68
<b>3 Discretization of partial differential equations</b>	<b>70</b>
3.1 Finite-difference approximations . . . . .	71
3.2 One-dimensional problems . . . . .	73
3.2.1 Forward elimination – backward substitution . . . . .	75
3.2.2 Backward elimination – forward substitution . . . . .	76
3.3 Band matrices . . . . .	78
3.3.1 Pentadiagonal matrices . . . . .	78

3.3.2	General band systems . . . . .	80
3.4	Two-dimensional problems . . . . .	83
3.4.1	Rectangular geometry . . . . .	83
3.4.2	Triangular geometry . . . . .	94
3.4.3	Hexagonal geometry . . . . .	96
3.4.4	Reduced systems . . . . .	101
3.4.5	Line orderings . . . . .	114
3.4.6	Computational molecules . . . . .	118
3.4.7	Irregular mesh structures . . . . .	121
3.5	Test problems . . . . .	122
<b>4</b>	<b>Standard iterative methods</b>	<b>129</b>
4.1	General theory of iterative methods . . . . .	129
4.1.1	Stopping criteria . . . . .	133
4.1.2	Starting vectors . . . . .	134
4.2	Point iterative methods . . . . .	135
4.2.1	Basic algorithms . . . . .	135
4.2.2	Consistent orderings . . . . .	138
4.2.3	The successive overrelaxation method (SOR) . . . . .	142
4.2.4	Determining the optimum relaxation parameter . . . . .	148
4.2.5	Experimental examination of SOR convergence . . . . .	158
4.2.6	Computational aspects . . . . .	171
4.3	Line iterative methods . . . . .	176
4.3.1	1-line algorithms . . . . .	178
4.3.2	2-line algorithms . . . . .	189
4.3.3	3-line algorithms . . . . .	193
4.4	Results of numerical experiments . . . . .	195
<b>5</b>	<b>Explicit prefactorization methods (AGA)</b>	<b>199</b>
5.1	Matrix notation . . . . .	200
5.1.1	Basic algorithms . . . . .	200
5.1.2	AGA algorithms with point modification . . . . .	208
5.1.3	AGA algorithms with line modification . . . . .	208
5.1.4	Techniques for accelerating convergence . . . . .	209
5.2	Implementing prefactorization algorithms in mesh structures . . . . .	213
5.2.1	Rectangular geometry . . . . .	213
5.2.2	Triangular geometry . . . . .	234
5.2.3	Hexagonal geometry . . . . .	240
5.3	Results of numerical experiments . . . . .	243
<b>6</b>	<b>Semi-explicit prefactorization with implicit backward sweep</b>	<b>248</b>
6.1	Matrix notation . . . . .	248
6.1.1	Modified line methods . . . . .	250
6.2	Implementation in mesh structures . . . . .	253
6.2.1	Rectangular geometry . . . . .	253
6.2.2	Triangular geometry . . . . .	260
6.2.3	Hexagonal geometry . . . . .	262
6.3	Numerical experiments . . . . .	265

<b>7</b>	<b>Semi-explicit prefactorization with implicit forward sweep</b>	<b>267</b>
7.1	Implementing OLA methods in mesh structures . . . . .	268
7.1.1	Rectangular geometry . . . . .	268
7.1.2	Triangular geometry . . . . .	285
7.1.3	Hexagonal geometry . . . . .	291
7.1.4	Successive overrelaxation . . . . .	294
7.2	Matrix notation . . . . .	295
7.3	Numerical experiments . . . . .	302
7.4	Final discussion . . . . .	304
<b>8</b>	<b>Advances in solving linear control systems</b>	<b>308</b>
8.1	Sylvester equations . . . . .	308
8.1.1	The SOR-like method . . . . .	309
8.1.2	Numerical experiments . . . . .	312
8.1.3	Sylvester equations: conclusion . . . . .	319
8.2	Continuous-time algebraic Riccati equations . . . . .	320
8.2.1	The SOR-like method . . . . .	320
8.2.2	Numerical experiments . . . . .	321
8.2.3	Concluding remarks . . . . .	323
<b>A</b>	<b>Numerical experiments for chapter 4</b>	<b>325</b>
A.1	Standard iterative methods: self-adjoint problems . . . . .	325
A.2	Standard iterative methods: non-self-adjoint problems . . . . .	351
<b>B</b>	<b>Numerical experiments for chapter 5</b>	<b>375</b>
B.1	AGA algorithms: self-adjoint problems . . . . .	375
B.2	AGA algorithms: non-self-adjoint problems . . . . .	455
<b>C</b>	<b>Numerical experiments for chapter 6</b>	<b>473</b>
	(Semi-explicit prefactorization with implicit backward sweep)	
C.1	Self-adjoint problems . . . . .	473
C.2	Non-self-adjoint problems . . . . .	487
<b>D</b>	<b>Numerical experiments for chapter 7</b>	<b>496</b>
	(Semi-explicit prefactorization with implicit forward sweep)	
D.1	Self-adjoint problems . . . . .	496
D.2	Non-self-adjoint problems . . . . .	514
	<b>Bibliography</b>	<b>529</b>
	<b>Index</b>	<b>535</b>
